STEP 19 — AI LITERACY EVIDENCE

AI Usage Log and Responsible AI Reflection

Purpose of the Document

This document records how AI tools were used as a support tool during the development of my portfolio and related academic projects. AI was used for brainstorming, explanations, drafting, coding assistance, research organization, document preparation, and revision. The final decisions, checking of requirements, correction of errors, and acceptance of outputs remained my responsibility.

AI Usage Log

Date	Task	AI Assistance	My Verification
2026-09-14	Data analysis project and hard-copy preparation	Used AI to organize the data-analysis document, explain tables/findings, and help prepare a PDF structure.	Checked the Excel values, datasets, graphs, tables, findings, and recommendations against the original file. Requested corrections when spacing or values did not match.
2026-09-15	Development methodology / project documentation	Used AI to turn the project requirements and example methodology into clear copy-paste documentation.	Compared the wording and sequence with the project's actual development process and adjusted it to fit the project.
2026-09-17	Complete data-analysis PDF	Used AI to structure the complete report and explain how formulas such as COUNTIF are used.	Verified that the report represented the Excel file accurately and requested larger text and corrected tables where necessary.
2026-09-19	Capstone development management	Used AI to create a simple, formal development-management section based on the provided example.	Checked that the content matched the capstone and remained easy to copy and present.
2026-09-21	Morality reviewer and academic PDF materials	Used AI to organize lesson content into a reviewer and prepare a readable PDF format.	Reviewed the generated content, formatting, page spacing, and whether important lesson topics were retained.
2026-09-23	Eos game / capstone character and project content	Used AI for character descriptions, roles, strengths, weaknesses, motivations, dialogue, and development documentation.	Checked character roles and project details and revised outputs that did not match the desired game style or project concept.
2026-09-28	Character design and game-development materials	Used AI to expand character concepts and organize descriptions for the Eos project.	Personally selected the desired character style and corrected outputs that did not fit the intended game-character presentation.
2026-10-07	Next.js / website development and project file management	Used AI for coding explanations, troubleshooting, project setup guidance, and advice about managing node_modules and project files.	Ran the project, observed actual results, checked the file structure, and decided what to keep or remove from the project backup.
2026-10-08	Cybersecurity specialization case study	Used AI to identify a suitable real-world cybersecurity case and organize it around the five required questions: vulnerability, cause, risks, prevention, and security practices.	Reviewed the case structure, checked that it focused on defensive cybersecurity, and ensured the final PDF answered every required question.

What did AI help me accomplish?

AI helped me accomplish several parts of my portfolio more efficiently. It helped me organize ideas, turn rough requirements into formal documentation, explain technical concepts, troubleshoot code, prepare academic materials, and structure project information. It was especially useful when I needed to convert information into a clear format that could be reviewed, edited, or included in a final document. AI also helped me identify possible approaches when I was unsure how to begin a task.

What did I personally verify?

I personally verified the information that was important to my submissions. For data-analysis work, I compared numbers, tables, graphs, and findings with the original Excel file. For coding tasks, I checked the actual project behavior and file structure rather than assuming that generated instructions would work. For research and cybersecurity content, I checked whether the material answered the required questions and whether the recommendations were appropriate and defensive. I also reviewed formatting, wording, page spacing, and project-specific details before using the outputs.

What did I learn from using AI?

I learned that AI is most useful as an assistant rather than a replacement for my own judgment. I learned how to ask clearer and more specific questions, how to provide requirements and examples, and how to revise AI-generated results until they fit the actual project. I also learned that understanding the reason behind an answer is important, especially for programming, cybersecurity, research, and data analysis. Using AI effectively requires knowing enough about the subject to evaluate its suggestions.

What limitations or errors did I discover in AI-generated answers?

- AI can misunderstand project-specific requirements when instructions are incomplete or when an example is interpreted incorrectly.
- AI-generated documents may contain formatting problems such as excessive spacing, incorrect page breaks, or tables that need adjustment.
- AI can produce technically plausible coding advice that still needs to be tested in the user's actual project environment.
- AI can make factual mistakes or provide information that should be checked against reliable sources, especially for real-world incidents and research.
- AI may generate content that is too general, too detailed, or inconsistent with the user's intended style, requiring revision.
- AI does not automatically know which project details are correct; the user must provide context and verify the final result.

Responsible AI Use Statement

I used AI as a productivity and learning tool while maintaining responsibility for my work. I did not treat AI-generated answers as automatically correct. I reviewed, tested, corrected, and adapted AI-assisted outputs according to my project requirements. The purpose of using AI was to improve my workflow and understanding while still applying my own judgment and verification.

Conclusion

My experience with AI showed me that responsible AI literacy involves both effective use and critical evaluation. AI can save time and help with difficult tasks, but its outputs require human verification. Through my portfolio activities, I learned to use AI for assistance while remaining responsible for the accuracy, relevance, security, and quality of the final work.
