Chanalie Dajay
BSIT 4th Year – Set A

STEP 23 — IT CAREER DEVELOPMENT PLAN

Career Goal: Data Analyst and Future Master's Degree Student

Career Direction

My long-term career direction is to specialize in data analytics after completing my BSIT degree. I plan to gain practical IT and data experience first, then pursue a master's degree in data science, analytics, or a closely related field. My goal is to develop both technical and academic expertise so I can work professionally as a data analyst and eventually take on more advanced analytical responsibilities.

Career Area	Development Plan
Target Position	Entry-Level Data Analyst / Junior Business Intelligence (BI) Analyst, with the long-term goal of progressing into advanced analytics roles.
Target IT Field	Data Analytics — with particular interest in data cleaning and preparation, data visualization and dashboards, business intelligence, reporting, and data-driven decision support.
Current Skills	Basic web development, HTML/CSS/JavaScript, programming fundamentals, database concepts, SQL, data analysis, basic networking concepts, troubleshooting, documentation, and experience using AI as a productivity and learning tool.
Skills to Improve	Advanced SQL, statistics and probability, data cleaning and wrangling, data visualization and storytelling, Excel (advanced), Python for data analysis, dashboard design, business and domain understanding, and communicating insights to non-technical audiences.
Technologies to Learn	Microsoft Excel (advanced functions, PivotTables), SQL (PostgreSQL/MySQL), Python (pandas, NumPy, Matplotlib), Power BI, Tableau, Jupyter Notebook, Git/GitHub, Google Sheets, and cloud data fundamentals.
Certifications to Consider	Google Data Analytics Professional Certificate or Microsoft Power BI Data Analyst (PL-300) as an initial credential; later consider certifications aligned with experience and career direction, such as Tableau certifications or other recognized analytics credentials.
6-Month Goal	Build a stronger data analytics foundation by studying advanced SQL, statistics, Excel, Python, and data visualization. Complete practical projects using real datasets, build a data analytics portfolio with dashboards and written case studies, and begin preparing for an entry-level analytics certification.
1-Year Goal	Obtain or actively pursue an entry-level data analyst position or internship, strengthen hands-on analytics experience, complete relevant projects and dashboards, and prepare for or begin a recognized data analytics certification.
3-Year Professional Goal	Become an established data analyst with practical work experience and begin or complete a master's degree in data science, analytics, or a related field. Develop deeper expertise in business intelligence, advanced analytics, data engineering, or another specialized area.

Personal Development Strategy

I will follow a gradual path: strengthen my current BSIT foundation, gain hands-on data analytics experience, obtain relevant certifications, build professional experience, and then pursue master's-level study. I will prioritize practical understanding instead of collecting certifications without experience. My portfolio will be used to document projects, dashboards, data-cleaning cases, analytical research, and other evidence of my developing skills.

Career Vision

My ultimate goal is to become a knowledgeable and capable data professional who can turn raw data into clear insights, identify trends and problems, support better decisions, and continuously improve organizational performance. Pursuing a master's degree in data science or analytics will support my long-term goal of developing deeper technical knowledge, research ability, and professional expertise.
