Chanalie Dajay
BSIT 4th Year – Set A

STEP 24 — FINAL REFLECTION

My Journey as a BSIT Student

Before I joined the BSIT program, I thought of Information Technology mainly as computers, software, websites, and everyday technology use. I knew it involved programming and computer systems, but I had no idea how many different areas made up the field. I was curious about technology, yet I had never gone through the full cycle of planning, building, troubleshooting, documenting, and presenting an IT project from start to finish.

The biggest lesson I took from BSIT is that IT goes far beyond programming. Along the way I studied databases, web development, networking, data analysis, system troubleshooting, cybersecurity, project development, documentation, and the responsible use of technology. I also found that fixing an IT problem takes patience and a methodical approach. Rather than guessing at an answer, I learned to define the problem, think through its possible causes, collect evidence, test fixes, and confirm that the result actually works. This way of thinking has been the most valuable skill the program gave me.

The project that taught me the most was my web development work, because it forced me to use many skills together. Building and improving websites showed me how the frontend, backend logic, databases, project files, and development tools fit together. It also exposed me to the everyday realities of keeping a project running: handling dependencies, fixing errors, reviewing the project structure, and confirming that each change really did what I intended. I came to see that producing a working application takes more than writing code. It needs planning, testing, organization, and steady improvement.

Troubleshooting was the hardest technical challenge I faced in my development projects. Often the real cause of a problem was somewhere other than the code I was staring at, and finding it meant checking configurations, dependencies, files, or the environment itself. This was sometimes frustrating, but it taught me to work through problems one step at a time instead of changing many things at once. I also learned to treat an error message as a helpful clue rather than something to brush aside.

My IT skills have grown a great deal since I began the program. I am more at ease with programming concepts, web development, databases, troubleshooting, technical documentation, and organizing projects. I can break down technical problems more logically and explain my solutions more clearly. Working on a variety of projects has also given me the confidence to pick up unfamiliar technologies. In addition, I have learned to use AI tools responsibly, relying on them for brainstorming, explanations, coding help, and documentation while always checking the results myself.

Still, there is a lot I want to improve. I plan to build up my SQL, statistics, data cleaning, data visualization, and Python skills for data analysis, as well as my ability to handle larger and more complex datasets and systems. I understand that graduating from BSIT does not mean my learning is over. Technology keeps changing, so I will need to keep studying and practicing throughout my career.

The kind of IT professional I hope to become is a data analyst. I am especially drawn to turning raw data into clear insights, building reports and dashboards, spotting trends and problems, and helping organizations make better decisions. In the long run, I plan to earn a master's degree in data science or analytics to deepen my technical and academic knowledge. I want my career to blend hands-on experience with continuous learning and specialization.

I feel ready to start my IT career because BSIT gave me more than technical knowledge. It taught me how to learn, troubleshoot, adapt, document my work, and take responsibility for the quality of what I produce. I still have plenty to learn, but I know that a career in IT is a continuous process of growth. I am prepared to begin in an entry-level role, gain real-world experience, learn from seasoned professionals, and keep building my data analytics skills. My BSIT journey has given me a solid foundation, and I am ready to build on it as my professional career begins.
